

Weekly Workflow — DCM Weekly : ■■■■ Macro

One Excel in. Website + PowerPoint + PDF out.

The whole system in one picture

Your weekly Excel file feeds a single command that produces everything:

- **index.html + data.json** — upload these to GitHub; your live website updates itself.
- **DCM_Weekly_<date>.pptx** — the slide deck, for emailing colleagues.
- **DCM_Weekly_<date>.pdf** — a PDF copy of that same deck, for emailing.

The website has two layers, each clearly badged on the page: a **LIVE** layer (green dot — BDT crosses, FX majors, crypto, gold, regional CPI) that refreshes every 5 minutes on its own from free APIs, and a **WEEKLY** layer (gold dot — everything from your Excel). The emailed deck and PDF contain the **weekly layer only**, because live prices exist only in the browser at view-time and cannot be frozen into a slide honestly.

Your weekly routine

1. Update **bd_macro_data.xlsx** exactly as you do today (same sheets: Meta, KPIs, Series, Commentary, Calendar, Special).
2. Run one command in the folder holding the scripts:

```
python build_all.py bd_macro_data.xlsx
```

3. Upload the refreshed **index.html** and **data.json** to your GitHub repository (drag-drop, replace the old ones). The site updates within a minute.
4. Email the generated **.pptx** and/or **.pdf** to colleagues.

That's it. Steps 2–4 take about five minutes.

The files, and what each does

File	Role	Changes weekly?
bd_macro_data.xlsx	Your data source	Yes — you edit it
build_all.py	Runs the whole pipeline	No
make_data.py	Excel to data.json (website data)	No
make_deck.py	data.json to PPTX + PDF (deck)	No
commentary.py	Shared auto-commentary engine (used by both)	No
index.html	The website design + logic	No — auto-updated by the script
data.json	The week's numbers for the website	Yes — produced each run

Running the pieces individually (optional)

- Website data only: `python make_data.py bd_macro_data.xlsx`
- Deck only (PPTX + PDF): `python make_deck.py data.json --pdf`
- Deck without PDF: `python make_deck.py data.json`

What you need installed once

- **Python 3** with three packages: `pip install pandas openpyxl python-pptx`
- **LibreOffice** — only needed for the PDF step. On Windows install from libreoffice.org; the script finds it automatically. If LibreOffice is missing, the PowerPoint is still produced; only the PDF step is skipped.

The interactive charts

The website charts are now fully interactive: hovering (or tapping on mobile) shows a crosshair and a floating box with each line's value for that month. Nothing to configure — it works from your Series sheet automatically. The more months you keep in the Series sheet, the longer the history the charts display.

Before going public — two edits in the Excel Meta sheet

1. **ForAudience** currently reads "For Prime Bank Officials - Internal Usage Only" and is printed on both the website and the deck title slide. Change it to something public, e.g. "For treasury professionals, asset managers & investors".
2. **Headline** is optional: leave it blank and the website auto-writes a summary sentence from your KPIs; type your own to override it any week.

Optional: remove the Python step entirely

GitHub can run `make_data.py` for you (GitHub Actions), so you would upload only the Excel file and GitHub produces `data.json` automatically. The deck/PDF would still be generated locally when you want to email them. When ready, ask Claude to "add the GitHub Action" with your repository name.

Hosting recap

GitHub repository holds: `index.html`, `data.json`, and the three `.py` scripts. Cloudflare Pages publishes the repo to your domain (see the Hosting Manual). Only `index.html` and `data.json` affect the website; the scripts and Excel can live in the same repo harmlessly or be kept on your computer.

Auto & manual commentary (how the words are written)

Every section has an "Analyst commentary" area on the website and a "KEY TAKEAWAYS" block on the matching slide. These follow one rule, identical on website, PowerPoint and the cover paragraph:

- **Leave the Commentary cell blank** in Excel and the system writes the sentence(s) automatically from that week's data changes (e.g. "Call money fell 0.25pp to 9.75%").
- **Write your own note** and it appears first (marked with a diamond), with the automatic sentences still shown beneath it. Your words never suppress the data summary — they add to it.
- The **cover/intro paragraph** (top of the website and the deck's title slide) is auto-written from the headline numbers when Meta -> Headline is blank, and shows exactly your text when you fill it in (here your text replaces the auto one, since it's a single intro line).
- The **Special section** is different: it appears only when you fill the Special sheet, and is meant for occasional events (Monetary Policy Statement, new Bangladesh Bank / BSEC rules). Leave it blank and the section, its nav link and its slide all disappear.

All of this lives in `commentary.py`, shared by the website builder and the deck builder, so the three outputs always say the same thing.
